DataAge 
 Financial Transaction Software Solutions

INTRODUCING

KeyDX

What is KeyDX?

KeyDX is a web reporting service that captures real-time transactional data from separate pawn locations and centralizes that data, enabling sharing of information between multi-stores. Data Age provides each pawn operation with a secure and private web site that helps a multi-store operation reach new levels of efficiency.

Pawnbrokers can perform customer look-ups across stores, share inventory data and have the freedom to do so from anywhere in the world.

KeyDX can also be accessed from SmartPhones, iPads, or any Internet browser program.

Why use KeyDX?

Multi-store owners and management rely on key performance indicators found in dashboard reporting and snapshots of what is happening with their business daily. But, when the Internet connections are unavailable, so is the information. Until now!

Data Age addresses this technical weakness with our new reporting service solution called KeyDX. Businesses can protect operations with software installed locally, a central repository from which to access data, compiled metrics, performance intelligence, and a sound decision-support services platform.

KeyDX operates locally and when the Internet becomes available again, KeyDX automatically refreshes the repository to make sure Users can see their entire operation – whether they wish to see nationwide results, regional results, a district, or just a couple of stores.

The System Administrator for KeyDX oversees the assignment of Users, Roles, and Groups so that access is limited and dependant on permission statuses established within each enterprise.
